

POLIALL HINGES

The POLIALL HINGES consist of a polyurethane profile enclosed between two lengths of aluminium section. Their typical applications are side and rear doors requiring a continuous hinge with very limited protrusion to prevent the ingress of water and dust. They can be installed using rivets or self- tapping screws.

The POLIALL hinges can be used on any type of door. However, they are mostly used in fully opening folding side doors and rear hatch doors with under door locking systems.

Use standard care and caution and follow these warnings:

- Select a type of hinge suitable for the door weight and thickness.
- Fasteners must be the adequate thickness, length and capacity for the load and stress involved in the application.
- Fatigue and material strength tests at different temperatures available.
- Periodically ensure that fasteners are properly tightened and check the polyurethane components for wear.
