

DOOR CHECKS

Door checks keep the door open when it is resting on the side of the van and come in two basic designs:

- a two-piece design with a male element mounted on the door and the female element installed to the wall.
- a one-piece design mounted under the frame.

Use standard care and caution and follow these warnings:

- Door checks are designed to keep the doors open when the vehicle is stopped and parked on level ground.
- Never move the vehicles with the doors open.
- For under chassis version, ensure that the arm is into the stop hole when stopped, and when closing follow the arm by keeping it firmly through its handgrip.
- For two-piece design, ensure that the male part is firmly engaged into the female slot.
